

Thermo Scientific Model 46i

Nitrogen Oxide Analyzer

Utilizes gas filter correlation technology to measure ambient levels of nitrous oxide concentrations

The Thermo Scientific™ Model 46i Nitrous Oxide Analyzer utilizes gas filter correlation technology to measure ambient levels of Nitrous Oxide (N₂O) concentrations.

Features

- Gas filter correlation technology
- Linearity through all ranges
- Dual and auto range modes
- Automatic pressure and temperature correction
- Long-term zero and span stability

Introduction

The Thermo Scientific Model 46i Analyzer helps users to comply with global greenhouse gas regulations. Nitrous Oxide has been identified as a primary greenhouse gas with a greater potential for global warming effects than Carbon Dioxide (CO₂).

The Model 46i Analyzer uses an exact calibration curve to accurately linearize the instrument output over any range up to a concentration of 50 ppm, and is available in both dual and auto range modes.

In addition, the Model 46i Analyzer features automatic pressure and temperature correction that provides an increased resistance to shock and vibration while delivering enhanced specificity and sensitivity.

Ethernet connectivity provides efficient remote access, allowing the user to download measurement information directly from the instrument without having to be onsite.

Easily programmable short-cut keys allow you to jump directly to frequently accessed functions, menus or screens. The larger interface screen can display up to five lines of measurement information while the primary screen remains visible.
